

Student **Management System**

Presented By-

1202-Maniram

1223-Tanmai

Project Description:

The purpose of the student management system is to store the data for longer periods of time. So that accessing the data and manipulating and maintaining the database becomes easy.

Student management system will help us in focusing on the important aspects rather than record keeping. Thus it will help in better utilization of resources.

Features:

- It tracks all the information of the student.
- It will manage all the information of the student.
- Shows the details of the student in a descriptive way.
- To increase the efficiency of managing the student details.
- Editing, adding and updating the details is easy.

Procedure:

- Firstly in the login page we must enter the details such as username and password. If the details match with database details then the home page will appear else it will redirect to the login page.
- In the home page we have used the basic frameset concept and divided the page into the desired look.
- The placement and gallery pages are designed using basic html tags.
- The display is used to display the details of the student whose name is given matching with the database details.
- The add is used to add the form details to the database.
- The remove is used to remove the details from the database whose username is entered.
- The logout is used to redirect to the login page.

Functions:

- **Display:**

The details of the student whose username is given in the form will be displayed.

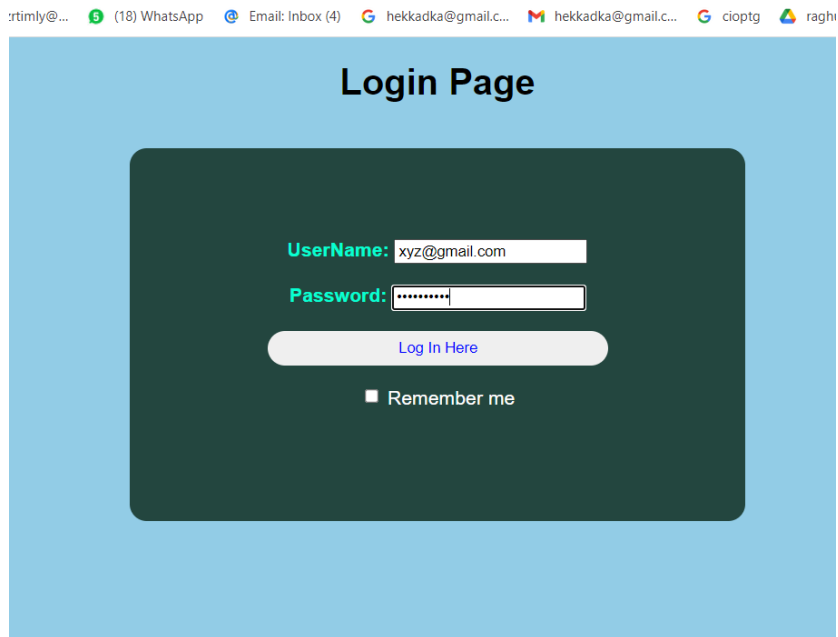

- **Add:**

The details entered in the form will be updated in the database.

- **Delete:**

The details of the student will be removed from the database whose username is given in the form.

Sample Code:

```
import javax.servlet.http.*;

import javax.servlet.*;

import java.io.*;

import java.sql.*;

import java.lang.*;

public class Demo2 extends HttpServlet{

    public void doGet(HttpServletRequest req,HttpServletResponse res)

        throws ServletException,IOException

    {

        res.setContentType("text/html");

        PrintWriter pw=res.getWriter();

            try {

                Class.forName("com.mysql.jdbc.Driver");

                Connection conn = null;

                Statement selectStmt = null;

                conn =

                DriverManager.getConnection("jdbc:mysql://localhost:3306/test","root", "");

                String un = req.getParameter("n1");

                String paw = req.getParameter("n2");
```

```

selectStmt = conn.createStatement();

ResultSet rs = selectStmt.executeQuery("SELECT * from login");

while(rs.next())
{
    String s1=rs.getString(1);

    String s2=rs.getString(2);

    if(s1.equals(un) && s2.equals(paw))
    {
        req.getRequestDispatcher("index1.html").include(req,res);
    }
}

conn.close();
}

catch(Exception e) {
    pw.println("<h1>error</h1>");
}

req.getRequestDispatcher("index.html").include(req,res);

pw.close();

}}

```

Languages Used:

- Java
- Html tags
- Css

Technical Aspects:

- Tomcat Server
- XAMPP

Challenges Faced:

- Connecting to the database
- Extracting the data
- Inserting into the database from the form.
